

The Persona Duel

The Impact of AI on Job Creation in Emerging Markets

1. Persona Definitions

Persona A — Ethan Carter

Role

CEO of a global AI technology company based in Silicon Valley.

Backstory

Ethan Carter grew up in the United States and studied computer science and economics at Stanford University. He founded a successful AI company that works with governments and businesses across the world. He believes technology is the main driver of economic growth and global development.

Communication Style

- Formal and professional
- Uses business and economic language
- Speaks with confidence and data-driven arguments
- Focuses on long-term global impact

Values

- Innovation
- Efficiency
- Economic growth
- Global scalability
- Technological advancement

Vocabulary

Uses words such as:

- "digital transformation"
- "scalability"
- "productivity"
- "market expansion"
- "innovation ecosystem"
- "economic opportunity"

Persona B — Amina Njoroge

Role

Founder of a small Nairobi-based startup that helps local businesses use technology.

Backstory

Amina grew up in Nairobi and built her startup after seeing many young people struggle to find jobs. She works directly with small businesses, delivery riders, freelancers, and local communities. She believes technology should improve everyday life and create practical opportunities for ordinary people.

Communication Style

- Friendly and relatable
- Speaks in simple and direct language
- Uses real-life examples
- Emotional and community-focused

Values

- Community empowerment
- Fair opportunities
- Practical solutions
- Youth employment
- Local business growth

Vocabulary

Uses words such as:

- "real people"
- "small businesses"
- "daily survival"
- "local communities"
- "young people"
- "practical opportunities"

2. Debate Transcript

Debate Topic:

"The Impact of AI on Job Creation in Emerging Markets"

Round 1

Ethan Carter

AI will become one of the biggest engines of economic growth in emerging markets. Countries in Africa, Asia, and South America can use AI to improve healthcare, agriculture, banking, and education. While some traditional jobs may disappear, many new digital jobs will be created. History shows that technological revolutions increase productivity and create new industries over time.

Amina Njoroge

That sounds good in theory, but many people in emerging markets are worried about surviving today, not “over time.” In Nairobi, I meet young people who already struggle to get jobs. If companies replace customer service workers, cashiers, or drivers with AI systems, many families will lose income immediately. We cannot only focus on future opportunities while people suffer now.

Round 2

Ethan Carter

I understand the concern, but resisting AI is not the solution. Instead, governments and businesses should invest in digital skills training. AI can create opportunities for software developers, data analysts, AI trainers, and remote workers. Emerging markets actually have an advantage because they can adopt modern technologies faster than older economies with outdated systems.

Amina Njoroge

Training is important, but we must be realistic. Many young people do not have laptops, stable internet, or access to quality education. Telling everyone to become a data analyst is not practical. We also need AI solutions that support ordinary workers instead of replacing them. Technology should help small businesses grow, not only benefit large global companies.

Round 3

Ethan Carter

Large technology companies can help by investing in local innovation ecosystems. Partnerships with startups, universities, and governments can expand access to AI tools. For example, AI-powered farming systems can help farmers predict weather patterns and improve crop production. That creates economic value and supports local communities.

Amina Njoroge

I agree AI can help farmers and small businesses. I have seen local shop owners use AI marketing tools to attract customers online. But there is also a danger when foreign companies control the technology and profits. Emerging markets should not become only consumers of AI products. Local entrepreneurs must also build and own technology solutions.

Round 4

Ethan Carter

That is a fair point. Local ownership is important for sustainable development. However, international investment is still necessary because AI infrastructure requires large amounts of capital and expertise. Collaboration between global firms and local innovators can accelerate economic growth faster than isolated local efforts.

Amina Njoroge

Collaboration works only when both sides benefit fairly. Too often, global companies collect data from African users while local communities receive little value in return. AI policies should protect workers and encourage local job creation. Otherwise, AI may increase inequality instead of reducing it.

Round 5

Ethan Carter

Ultimately, AI is a tool. If governments create strong policies and education systems, AI can unlock massive opportunities in emerging markets. The countries that embrace innovation early will likely become future technology leaders.

Amina Njoroge

I believe AI can help emerging markets, but only if people stay at the center of the conversation. Technology should solve real community problems, create accessible jobs, and include local voices. Success should not only be measured by profits, but also by how many lives improve.

3. Summary Analysis

Both personas presented strong arguments, but Amina Njoroge was more convincing overall.

Her arguments felt more realistic because she focused on the immediate struggles faced by ordinary people in emerging markets. She used relatable examples involving small businesses, youth unemployment, and local communities. This made her responses feel emotional, practical, and grounded in reality.

Ethan Carter presented logical and forward-thinking arguments about innovation, economic growth, and global competitiveness. His points were strong from a business and economic perspective. However, his responses sometimes felt too focused on long-term benefits without fully addressing short-term social challenges.

The framing of each persona greatly affected the quality of the debate:

- Ethan's formal and corporate framing created responses that sounded strategic and global.

- Amina's local and relatable framing produced responses that felt human and practical.

This project shows that persona definition strongly influences AI output. Background, tone, values, and vocabulary all shape how ideas are presented and how convincing they become. Clear persona design leads to more realistic and engaging AI conversations.
